

Visualising Practices with Generative AI

Step 1:
Using a text-to-image platform, write prompts to visualise a design practice or generate examples of design that incorporate generative AI and embody any of the characteristics you identified last week (Print this image and tape it to this worksheet)

You are not expected to deliver the “right” kind of image/s but to see what images are generated in response to your prompts and then to think through why they are how they are!

Step 2:
Analyse this image using the prompts on the right hand side of this sheet, annotating it as you go. Write down why you think the practice was visualised by the model in this way?

Step 3:
Upload your image to chatGPT and ask it to analyse it. Think about how you prompt this, and coach it towards a “deeper” analysis of the image. Using a different colour or style, add this analysis to your annotations.

Step 4:
Prompt engineer to get an image that does what you want it to do.

How might you adjust the prompt to achieve an image that is more in line with the practice or design you imagine?

Example prompt:

A design studio where a group of designers are creating an accessible visualisation using AI.

What objects, places, scenes are shown? How are they depicted?

What people are present? What can you tell about them?

What symbols or other signifiers are employed & why?

What world does this image exist in? What would you depict otherwise?

What medium/style is being used to represent the image? How does the medium effect how we read the image?

Why do you think image is this way? i.e. what cultural ideas or biases are present?
